

Reports Module Chart Guide

Which chart each report uses, and why that chart fits its data

The Reports page in the admin portal has ten tabs, and sixteen charts appear on them. This guide lists every chart by the section it appears in, names the type of chart, and explains why that type suits the data it shows. An appendix covers five more charts that are built but sit on three tabs that currently have no button in the Reports tab bar.

The screenshots were taken from the real report components using sample data, not live records, with the date set to 29 September 2026.

How each chart type was chosen

The kind of data decides the chart. The same kind of data gets the same chart in every report, so a reader who learns one chart can read the others.

KIND OF DATA	CHART USED	WHY IT FITS
A count per day, split by status	Stacked column chart	Each day is one column. Its height is the day's total, and the coloured parts show how that total divides by status. Counts are whole numbers per day, so separate columns are used instead of a line, which would suggest values between days.
A money amount per day or month	Area chart	One amount moving over time. The line shows the direction and the shaded area makes each period's amount easy to see. Periods with no sales stay on the axis at zero.
A level measured over time, such as a percentage or an average	Line chart	The value exists at every point in time, so a connected line fits. The axis covers the whole scale so small changes are not exaggerated.
Items ranked by one number	Sorted column chart	Bars start at zero, so their lengths can be compared directly. Sorting from largest to smallest makes the ranking read left to right.
Two quantities per item, in the same unit	Grouped column chart	Two bars side by side for each item make the difference between them visible.
The parts of a whole, for each item	100% stacked column or stacked bar	Each bar is one whole, and its parts show how that whole divides.
How many items fall at each step of an ordered scale	Column chart in scale order	Keeping the scale in order, such as 1 to 5 stars, shows the shape of the spread. A pie chart would lose that order.

Colours mean the same thing across reports: green for done, delivered, resolved or positive; amber for pending, open or neutral; red for cancelled, rejected, negative or too low; blue for planned, processing or a plain quantity.

All charts at a glance

	SECTION	CHART	CHART TYPE
1	Purchase Requests	Daily Purchase Request Trend	Stacked column chart
2	Purchase Orders	Daily Purchase Order Trend	Stacked column chart
3	Transaction Records	Transaction Revenue Trend	Area chart
4	Logistics Records	Dispatch & Delivery Volume	Stacked column chart
5	Replacement Records	Replacement Request & Resolution Trend	Stacked column chart
6	Retail Sales	Retail Sales Velocity	Area chart
7	Top Clients	Top Clients Revenue Leaderboard	Sorted column chart
8	Warehouse	Warehouse Capacity vs Used	100% stacked column chart
9	Warehouse	Storage Utilization Trend	Line chart
10	Inventory · Fast-Moving Products	Top Fast-Moving Products by Normalized Volume	Sorted column chart
11	Inventory · Stock Movement	Inventory Movement by Product	Grouped column chart
12	Inventory · Stock Movement	Stock In vs Stock Out Trend	Line chart, two lines
13	Inventory · Low Stock Alerts	Low Stock Alerts	Grouped column chart
14	Feedback	Ratings Distribution	Column chart in scale order
15	Feedback	Satisfaction Trend	Line chart
16	Feedback	Service Dimension Breakdown	Horizontal stacked bar chart

The Inventory tab's fourth report, Batch Expiry, is a table and has no chart.

PURCHASE REQUESTS

1 Daily Purchase Request Trend

Chart type **Stacked column chart**

Data Number of purchase requests per day, by the day each was submitted, split by current status: Approved, Pending, and Rejected / Cancelled. It covers the 14 days up to the latest request.

Why this chart. The data is a count of requests per day, and every request has exactly one status, so the statuses add up to the day's total. Stacking shows both at once: the height of each column is how many requests came in that day, and the coloured parts show how many were approved, are still waiting, or were turned down. Days with no requests stay on the axis as empty columns, so quiet days are visible instead of disappearing.

PURCHASE ORDERS

2 Daily Purchase Order Trend

Chart type **Stacked column chart**

Data Number of purchase orders per day, by the day each was approved, split by stage: Delivered, Processing, Cancelled, and Other stages. It covers the 14 days up to the latest purchase order.

Why this chart. Like the purchase requests chart, this is a daily count where each order is in exactly one stage. The "Other stages" segment collects the remaining stages, such as approved or out for delivery, so that every order is counted in the column and its height is a true daily total. The same chart type as chart 1 lets the two procurement reports be read the same way.

TRANSACTION RECORDS

3 Transaction Revenue Trend

Chart type **Area chart**

Data Revenue in pesos per day from delivered orders only, grouped by the day each order was placed. It covers the 14 days up to the latest delivered transaction.

Why this chart. There is a single amount of money for each day, and the question is how it moves over time. A line shows the rise and fall, and the shaded area under it makes the size of each day's revenue easier to see than a bare line. Only delivered orders count, which is the same rule every revenue figure in the Reports page uses, so this chart agrees with the revenue totals elsewhere.

LOGISTICS RECORDS

4 Dispatch & Delivery Volume

Chart type **Stacked column chart**

Data Number of delivery trips per day, split by current status: Completed, In Progress, and Planned. It covers the 14 days up to the latest trip.

Why this chart. A trip is always in one of three states, planned, in progress or completed, so the three segments add up to every trip that day. The column height shows how busy dispatch was, and the colours show how much of that work is finished. Whole trips per day are shown as columns rather than a line.

REPLACEMENT RECORDS

5 Replacement Request & Resolution Trend

Chart type **Stacked column chart**

Data Number of replacement requests per day, by the day each was reported, split into Resolved / Replaced, Rejected / Cancelled, and Open / In-Progress. It covers the 14 days up to the latest report.

Why this chart. Every replacement request ends up in one of three places: it was replaced, it was closed without a replacement (rejected by an admin or cancelled), or it is still being handled. Those three add up to the day's total, so stacking shows both the number of reports and how many have been dealt with. Rejected and cancelled requests have their own red segment, the same label and colour as the purchase request chart, so they are not mistaken for open work.

RETAIL SALES

6 Retail Sales Velocity

Chart type **Area chart**

Data Point-of-sale revenue in pesos from completed sales. It shows one point per day for Today, the past 7 or 30 days, or a custom range, and one point per month for longer ranges. The screenshot shows the past 30 days.

Why this chart. As with chart 3, this is one money amount over time, so an area chart shows its direction and size. The time step changes with the range so that a year of sales stays readable. Days or months with no sales are kept on the axis at zero, so the line drops to zero on quiet days instead of running straight across them as if sales had happened.

TOP CLIENTS

7 Top Clients Revenue Leaderboard

Chart type **Sorted column chart**

Data Delivered revenue for the eight highest-spending clients in the selected period, largest first. Clients whose orders have not been delivered yet are left out.

Why this chart. The job is to rank named clients by one amount. Columns that start at zero let the eye compare their heights directly, and sorting them from largest to smallest makes the rank read left to right. The chart is limited to eight clients so every name fits under its column; the full list is in the table below the chart.

WAREHOUSE

8 Warehouse Capacity vs Used

Chart type	100% stacked column chart
Data	For each warehouse, the share of its capacity that is used and the share still free. The tooltip adds the number of units for each part.

Why this chart. Each warehouse is a whole that divides into used and free space. Drawing each one as a column that always reaches 100% shows how full it is at a glance, and using percentages lets a small warehouse and a large one be compared fairly. Used is blue and free is green, the same colours as the capacity chart on the Warehouses page.

9 Storage Utilization Trend

Chart type Line chart

Data The percentage of total warehouse capacity in use at the end of each day in the selected range, on a 0–100% axis.

Why this chart. Utilization is a level, how full the warehouses are, and it has a value on every day, not a count of events. A connected line is the natural way to show a level moving over time. The axis always runs from 0 to 100%, so a change of a few points looks like a few points and is not stretched to fill the chart.

INVENTORY · FAST-MOVING PRODUCTS

10 Top Fast-Moving Products by Normalized Volume

Chart type Sorted column chart

Data The eight products with the most stock dispatched in the selected period, measured in case-equivalent units. The top three are coloured gold, silver and bronze.

Why this chart. This is a ranking, so the products are sorted from most to least moved on columns that start at zero. Products are sold in cases, packs and loose bottles, so quantities are converted to case equivalents first; otherwise a product sold by the bottle would look faster than one sold by the case. The ranking does not change when the table below it is sorted differently.

11 Inventory Movement by Product

Chart type **Grouped column chart**

Data Units received (Stock In) and units issued (Stock Out) for the five products with the most movement in the selected period.

Why this chart. Each product has two quantities in the same unit, and the question is how they compare. Putting the two bars side by side for each product shows at once whether more stock came in or went out. With only ten bars, each one can carry its exact value on top.

12 Stock In vs Stock Out Trend

Chart type **Line chart with two lines**

Data Units received and units issued per day for a 7-day range, per week for 30 days, and per month for longer ranges.

Why this chart. Two series in the same unit are compared over time. Two lines can be followed from left to right and can cross without hiding each other, which grouped columns would not manage over long ranges. The totals and the change against the previous period are shown in the cards above the chart, so the lines carry no labels on every point.

13 Low Stock Alerts

Chart type **Grouped column chart**

Data For up to five products below their minimum stock level, lowest stock first: current stock (red) and the product's stock threshold, labelled Reorder Point (blue).

Why this chart. For each product the reader needs to see how far current stock is from where it should be. Two bars side by side make that gap visible, and the difference between them is the shortfall to restock. Current stock is red because every product listed is below its threshold. A product that is out of stock shows no red bar at all.

FEEDBACK

14 Ratings Distribution

Chart type Column chart in scale order

Data How many ratings clients gave at each level from 1 to 5 stars in the selected period.

Why this chart. Star ratings are an ordered scale, so the columns stay in order from 1 to 5 and the shape of the spread is visible, for example mostly 4 and 5 stars with a small group of 1s. A pie chart would lose that order. The colours follow the same split the Feedback cards use: red for 1 and 2 stars (negative), amber for 3 (neutral) and green for 4 and 5 (positive).

FEEDBACK

15 Satisfaction Trend

Chart type Line chart

Data The average star rating for each of the last six months, on a 1–5 axis. It covers all feedback, whatever date range is selected.

Why this chart. An average rating is a level, so a line shows how satisfaction moves from month to month. The axis covers the whole 1–5 scale so a small dip is not made to look like a collapse. A month with no ratings is left as a gap in the line rather than drawn as zero or bridged, because no feedback is not the same as a score.

FEEDBACK

16 Service Dimension Breakdown

Chart type Horizontal stacked bar chart

Data For each service area, such as Timeliness, Order Accuracy or Driver Conduct, how many reviews mentioned it, split into negative, neutral and positive mentions.

Why this chart. Each service area is a whole, the number of times it was mentioned, that divides into three tones. Stacking the tones from negative to positive shows both how often an area comes up and whether clients were happy with it. The bars run horizontally because the area names are long and read more easily down the side than squeezed under columns.

These charts are built and working, but the Orders, Transport and Replacement tabs they sit on have no button in the Reports tab bar, so users cannot open them at the moment.

ORDERS

Orders by Day

Chart type	Column chart
Data	Number of orders per day, or per week for 90-day and all-time ranges. The title changes to "Orders by Week" when the columns are weekly.

Why this chart. Order volume is a whole-number count per period, so each period gets its own column. Switching to weekly columns on long ranges keeps the chart readable.

ORDERS

Order Status Breakdown

Chart type	Donut chart with a legend table
Data	The share of orders in the period that are Delivered, Pending or Cancelled.

Why this chart. This is one total divided into three parts that cover every order, which a donut shows at a glance. Donuts are poor for reading exact values, so the list under it gives each status's count and percentage.

TRANSPORT

Completion Band Distribution

Chart type Column chart in scale order

Data How many drivers fall in each delivery completion band: 0–39%, 40–69%, 70–89% and 90–100%.

Why this chart. The bands are an ordered scale, so, as with the star ratings, the columns stay in band order and run from red for the lowest band to green for the highest.

TRANSPORT

Top Drivers by Completion

Chart type Sorted column chart

Data Delivery completion rate for the top eight drivers, on a 0–100% axis. The tooltip shows each driver's trip count.

Why this chart. This ranks drivers by one percentage. Trip counts are a different unit, so they are kept in the tooltip instead of being drawn on the same axis, where a busy driver's trip count would stretch the percentage scale.

REPLACEMENT

Replacement Loss Trend

Chart type Line chart

Data The peso value of replaced items per day for a 7-day range, per week for 30 days, and per month for longer ranges.

Why this chart. One money amount is followed over time to show whether replacement losses are rising or falling. The time step grows with the range so long periods stay readable.
